

Windows python Guide

Install python

To check your current python version, open your command line by searching "Command Prompt"/"Eingabeaufforderung" in your operating system's search bar. Then run the following command:

```
python -V
```

If python is already installed on your computer, your current python version should be displayed (e.g. Python 3.12.6).

If not, download the latest python version from [this](#) website and execute the downloaded installer. After the installation ran through, check your version again to see that python is now installed.

After you successfully installed python, run the following command in your command line to update your pip package manager:

```
python -m pip install --upgrade pip
```

If, for some reason, your downloaded python version didn't include pip already, follow [these](#) instructions to install pip. After you successfully installed pip, run the above command again to see that pip is now being updated.

Get libraries with pip

To include a non-standard library/python package in your python project, you can install it using the pip package manager. Search the name of your library on [this](#) website to get the official name and pip install command. Copy the command and run it in your command line. You can either install it globally or in a virtual environment.

Example: [scipy](#)

```
pip install scipy
```

output

```
Collecting scipy
  Using cached scipy-1.14.1-cp312-cp312-win_amd64.whl.metadata (60 kB)
Requirement already satisfied: numpy<2.3,>=1.23.5 in c:\users\shredder\vscodeprojects\tm_digitalisierung\venv\lib\site-packages (from
Using cached scipy-1.14.1-cp312-cp312-win_amd64.whl (44.5 MB)
Installing collected packages: scipy
Successfully installed scipy-1.14.1
```

You can now import scipy into your python files and use it

```
import scipy
```
